Mon, 03 Dec 2018 22:03:00 GMT Accueil AVEF - During locomotion every stride involves forces at the hoof-ground interface that load the locomotor apparatus. Repeated application of forces that have a high magnitude and/or an abnormal direction of action, overload the limb and may lead to the development of pathological processes (Johnston & Back, 2006). When we have an insight how these forces work, we can modulate them by corrective ...
